

# Fotile·V As Smart As A GPS

Fotile·V is as smart as a GPS, whereby it locks down airborne grease that emanates from your pan and then leads the grease out of your kitchen and your home efficiently.

While cooking is a joy for most, Asian cooking tends to involve fumes and of course, oil which results in your kitchen becoming greasy. This problem can easily be solved with Fotile's new launched cooker hood, Fotile·V.

When it comes to hoods, the Fotile·V series is stylish yet packed with innovative functions such as the Automatic Airborne grease extraction system which locks down airborne grease from your pan and leads the grease out of your kitchen and home efficiently.

The unique 110 degree buffer plate prevents airborne grease from escaping while a wider chamber entrance ensures that every corner of the hood is evenly effective in locking down

airborne grease and leading it away, so you no longer have to worry about a greasy kitchen.

If the hood is detected to be low in pressure, the Automatic Turbo System increases pressure up to 350Pa to prevent air resistance and ensure that the hood is able to release airborne grease smoothly and effectively.

Fotile also discovered the Optimal Airborne Grease Control Zone which is located precisely 580mm above the kitchen hob and this zone is the perfect spot to capture airborne grease before it starts to spread.

A sleek and contemporary design topped with touch sensitivity buttons and amber backlit screen; Fotile·V is a proud recipient of

the acclaimed reddot Design Award. Other details include a double-layer filter, large stainless steel oil cup, energy-saving LED lights and shut-down delay function which allows the hood to continue working for two minutes after it is turned off to ensure that your kitchen smells clean and fresh.
